PROFILE

Senior AI Engineer who delivers end-to-end AI use cases in regulated financial services - client onboarding, KYC/document intelligence, and customer-journey automation. I build, deploy, and continuously refine production ML models and intelligent workflows that simplify customer interactions and automate onboarding, integrating them into live banking systems with clean, maintainable Python. I partner with product managers and data specialists across agile squads to turn business concepts into shipped technical designs, and I monitor model performance in production and iterate.

PROFESSIONAL EXPERIENCE

Senior AI Engineer / AI Engineer - Commercial Bank of Qatar, Doha *Jan 2024 - Present*

- Delivered end-to-end AI use cases across 7+ business squads at a regulated bank - owning build, deployment, and iteration - on a reusable platform (shared retrieval/embeddings service, evaluation framework, and model-serving API) that cut time-to-delivery for each new use case.
- Automated client onboarding by building an OCR & document-intelligence pipeline (7 extraction flows) that turns Arabic/English identity and financial (KYC) documents into structured data, accelerating onboarding document handling ~65% under strict traceability and data-residency controls.
- Simplified customer interactions with generative-AI workflows - an email & inquiry assistant handling 500+ requests/week (70% manual-load reduction, COO Problem Solver Award) and a RAG assistant giving citation-grounded answers over 900+ compliance documents at 87% accuracy.
- Integrated models into live banking systems through a FastAPI/REST serving layer with clean, maintainable code, model routing, fallbacks, and context engineering, cutting inference latency ~40% via optimized retrieval and containerized serving (Docker, Kubernetes, MLflow).
- Monitored model performance in production and shipped practical updates - post-deployment monitoring and feedback loops that detect retrieval regressions and hallucinations and feed them back into evaluation; releases gated on automated benchmarks, schema-validated outputs, and human review.
- Partnered with product managers, data specialists, risk, and compliance stakeholders to translate business concepts into functional technical designs and drive adoption across squads.
- Developed production AI workflows for credit-risk and financial analysis - retrieval, tool calling, LLM reasoning, and JSON-schema-validated outputs - producing structured, analyst-ready reports.
- Designed and deployed a real-time fraud-detection service (ROC-AUC 0.93) integrating engineered risk features, model evaluation, and monitoring to strengthen transaction- and onboarding-risk controls.

Software Engineer - MeeApps, Istanbul *Feb 2023 - Jan 2024*

- Built a low-latency order-execution platform - including smart order-routing and execution algorithms - adopted by 23 brokerage firms managing $10M+ in portfolios, achieving microsecond-level execution.
- Delivered the full production stack (React/C#/C++ frontend, backend services, and live market-data feeds) in a cross-functional team, optimizing ITCH, OUCH, and TCP protocols against co-located exchange servers for ultra-low latency.
- Owned end-to-end system performance and reliability, sustaining 99.9% uptime under live trading load.

Machine Learning Engineer - Schneider Electric, Istanbul *Jul 2022 - Dec 2022*

- Built and deployed demand-forecasting and stock-out-risk models that reduced inventory gaps 12-15% during COVID supply shocks, directly improving fulfillment reliability.
- Engineered features and reproducible model pipelines with rigorous evaluation (cross-validation, holdout testing) for scalable deployment, in Python (pandas, scikit-learn) and SQL.
- Partnered with logistics stakeholders to define success metrics and operationalize forecasts into fulfillment planning.

EDUCATION

BASc, Electronics Engineering - Sabanci University, Istanbul - 2018 - 2023

Exchange Semester, Electrical & Electronics Engineering - Universitat Politecnica de Valencia (UPV), Spain - 2022

TECHNICAL SKILLS

Financial Services AI: Client onboarding & KYC automation, customer-journey AI, fraud & transaction-risk, regulatory compliance (auditability, traceability, explainability, data residency)

AI Systems / GenAI: LLM systems, RAG (hybrid BM25+vector, reranking, citation grounding), tool / function calling, structured outputs & JSON-schema validation, prompt versioning, context engineering, agentic workflows

AI Engineering / LLMOps: Automated evaluation (retrieval quality, grounding, hallucination mitigation), production model monitoring & feedback loops, model routing & fallback strategies, latency optimization, reliability engineering

Production / Delivery: Python, FastAPI / REST APIs, backend & service architecture, model serving, Docker, Kubernetes, MLflow, agile squad delivery

ML Foundations: Supervised & unsupervised learning, feature engineering, time-series forecasting, A/B testing

Cloud & Languages: Azure, AWS, SQL | Python; full-stack (React, C#, C++)

SELECTED AI SYSTEMS

- **Client Onboarding / KYC Document Intelligence** - 7 extraction flows for Arabic/English ID & financial docs; ~65% faster, traceable
- **Customer-Journey AI Assistant** - 500+ inquiries/week automated; 70% manual-load reduction; COO award
- **Enterprise RAG Platform** - 900+ compliance documents; auditable, source-linked answers at 87% accuracy
- **Real-Time Fraud-Detection Service** - ROC-AUC 0.93; strengthened transaction- & onboarding-risk controls
- **Credit Risk & Financial-Analysis Workflows** - agentic, schema-validated, analyst-ready reports
- **Arabic<->English Translation Platform** - on-prem, data-resident; ~$120K/yr third-party spend eliminated

CERTIFICATIONS & COURSES

Operationalizing LLMs on Azure (Duke) | Generative AI Applications with RAG & LangChain (IBM) | AI Agents (IBM) | Generative AI Techniques & Applications (Duke) | Machine Learning Specialization (Stanford) | TensorFlow in AI/ML/DL (DeepLearning.AI) | Visa Data Science Bootcamp
